

Assignment 1: Sparse Matrices

1212550

November 4, 2018

Abstract

In this report we look at the implementation of the Gauss Seidel algorithm on various matrices.

1 Introduction

Here is an introduction into the problem. We are trying to plot the function

$$f(x) = \sin(x) \quad (1)$$

and its derivative.

2 Results

Here are some results. The function is approximated on a grid with $N = 128$ gridpoints. See figure 1 for results.

Figure 1: This is the figure. Left: Function $f(x) = \sin(x)$. Right: Derivative $f'(x) = \cos(x)$. Note that the x -axis shows gridpoint-indices and not the proper x value.
